

Sidequest wk 9

Process and decision documentation

Date used: Mar 20

Tool: Claude Opus 4.5

Purpose: development

- One significant decision i made was including a tool to view hitboxes so that developes can tell when the player collides with enemies and objects and adjust to waht feels right.
- I changed variables individually when needed
- Genai did not contribute to which settings i included in the debug menu and the decision making.

Appendix:

Keyan: add a debug screen with a button in the top right. use p5js. the debug screen should have a toggle button to allow for moon gravity

Claude: • Looks good. Here's what was added:

- DEBUG button — top-right corner (always visible), green text when panel is open, grey when closed. Click to toggle.
- Debug panel — centered overlay with a dark semi-transparent background and green border.
- Shows current gravity value (EARTH 10.0 or MOON 1.62)
- Moon Gravity toggle button — green when off, red when on. Clicking it sets world.gravity.y to either 1.62 (moon) or 10 (earth) live.
- All hit-testing uses the sketch's internal coordinate space (320×180), so it works correctly regardless of how the canvas is scaled in the browser.

Keyan: ui is pixelated. fix to be legible. add it as a top layer, currently its underneath the landscape. it should be top level. change moon gravity to 1.1

Claude: All clean. Here's what changed:

- Debug UI is now HTML — built with p5's createButton/createDiv DOM API, so it renders at full native resolution, completely sharp at any canvas scale.
- z-index: 9999 on all elements — guaranteed on top of the canvas and everything else.
- position: fixed — anchored to the viewport top-right regardless of canvas scaling.
- Moon gravity changed to 1.1 — reflected in both the constant and the label text.
- Removed all the old p5 canvas drawing functions (drawDebugButton, drawDebugPanel, handleDebugClick).

Keyan: add an toggle for showing hitboxes. lower the gravity on moon mode

Claude: Done. Three changes:

- Moon gravity lowered to 0.3 — very floaty, noticeable difference from before.
- Hitbox toggle added to the debug panel. Uses allSprites.debug = true/false which is p5play's built-in collider visualizer — shows all hitboxes including the player, sensor, ground tiles, etc.
- Both toggles use the same green/red on/off styling as the moon gravity button.
